Summary:

 This work addresses the challenge of adapting dynamic deadline requirements for LiDAR object detection deep neural networks (DNNs). The computing latency of object detection is critically important to ensure safe and efficient navigation. However, state-of-the-art LiDAR object detection DNNs often exhibit significant latency, hindering their real-time performance on resource-constrained edge platforms. Therefore, a tradeoff between detection accuracy and latency should be dynamically managed at runtime to achieve optimum results. In this paper, we introduce VALO (Versatile Anytime algorithm for LiDAR Object detection), a novel data-centric approach that enables anytime computing of 3D LiDAR object detection DNNs. VALO employs a deadlineaware scheduler to selectively process input regions, making execution time and accuracy tradeoffs without architectural modifications. Additionally, it leverages efficient forecasting of past detection results to mitigate possible loss of accuracy due to partial processing of input. Finally, it utilizes a novel input reduction technique within its detection heads to significantly accelerate execution without sacrificing accuracy. We implement VALO on stateof-the-art 3D LiDAR object detection networks, namely CenterPoint and VoxelNext, and demonstrate its dynamic adaptability to a wide range of time constraints while achieving higher accuracy than the prior stateof-the-art. Code is available athttps://github.com/CSL-KU/VALO}{github.com/CSL-KU/VALO.

Paper 2:

On the thermodynamic foundations of plasticity

Date: 2014-08-18 Time: 01:04:07

Authors:

Ván Péter Summary:

> - In this work the relation of plastic and rheological material models is analysed in the framework of non-equilibrium thermodynamics. After a short summary of the basic notions of classical elasticity and plasticity the traditional thermodynamic treatment of plasticity by Ziegler is introduced, where the plastic deformation is an internal variable, leading to the reduction of thermostatic stress. Then a simple thermodynamic treatment of static and dynamic friction follows. because the continuum generalization of these phenomena leads to viscosity and plasticity in our interpretation. Finally, plasticity is treated in the framework of non-equilibrium thermodynamics. The yield condition is the consequence of the dependence of the Onsagerian conductivity coefficients on the absolute value of the strain rate. Our treatment unifies rheology and plasticity in a common framework. --- Ebben az irasban a keplekeny es a reologiai anyagmodellek kapcsolatat tarqyaljuk a nemegyensulyi termodinamika alapjan. A klasszikus rugalmassagtan es keplekenysegtan alapfogalmainak rovid osszefoglalasa utan reszletesen vizsgaljuk a Ziegler-tol eredo termodinamikai keplekenysegelmeletet, amelyben a keplekeny deformacio a termosztatikai feszultseget csokkento belso valtozo. Ezutan a csuszasi es tapadasi surlodas egyszeru modelljet targyaljuk, mert esetunkben ezeknek a kontinuumokra torteno altalanositasa vezet a viszkozitashoz, illetve a keplekenyseghez. A keplekenysegi feltetelt az Onsager-fele vezetesi egyutthatoknak a belso valtozo sebessegenek abszolut erteketol valo fuggese hordozza. A keplekeny es a rugalmas deformacio idobeli valtozasat reologiai hatasokkal egyutt tarqyaljuk. (arXiv egyelore nem tud ekezeteket a kivonatban.)
